Abstracts

Turbine surface aerators are mechanical devices designed to enhance oxygen transfer in water bodies by utilizing a submerged or partially submerged turbine, which draws water from below and disperses it into the air, creating turbulence and maximizing the air-water interface for efficient aeration. These systems are primarily employed in wastewater treatment plants, aquaculture ponds, lakes, and industrial lagoons to promote aerobic conditions, support microbial activity, reduce odors, and prevent stratification, thereby improving water quality and supporting ecological balance. Characterized by their high oxygen transfer efficiency, adaptability to various water depths, and relatively simple maintenance requirements, turbine surface aerators are critical in applications where sustained dissolved oxygen levels are essential for process effectiveness and regulatory compliance.

The global Turbine Surface Aerator market size was estimated at USD 42.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
