Abstracts

A turbo combustion engine, commonly referred to as a turbocharged engine, is an internal combustion engine equipped with a forced induction system that increases power output and efficiency by compressing air entering the combustion chamber, allowing more fuel to be burned per cycle. It consists of a turbine driven by exhaust gases and a compressor that forces denser air into the engine, improving volumetric efficiency and enabling smaller engines to produce power comparable to larger naturally aspirated ones. This technology is widely applied across automotive, aerospace, marine, and industrial sectors to enhance performance while meeting stricter emissions and fuel economy standards.

The global Turbo Combustion Engine market size was estimated at USD 715.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of -3.50% during the forecast period.
