## Abstracts

Turf reinforcement mats are three-dimensional, permeable, and flexible geosynthetic products engineered to provide soil stabilization, erosion control, and vegetative support in challenging environmental conditions where traditional turf or revegetation alone would be insufficient. These mats are typically constructed from synthetic materials such as polypropylene or nylon, formed into a durable matrix that interlocks with soil and root systems to create a reinforced composite layer capable of withstanding hydraulic forces, traffic loads, and slope instability. They are widely used in applications including channel and shoreline protection, steep slope reinforcement, ditch linings, and construction site erosion prevention, offering a solution that combines mechanical strength with environmental compatibility by promoting sustainable vegetation growth while protecting the underlying soil structure.

The global Turf Reinforcement Mats market size was estimated at USD 450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
