Report Overview

The galvanometer scanning head mainly consists of XY scanning mirror, field mirror, galvanometer, and computer-controlled marking software. Select corresponding optical components based on different laser wavelengths. Related options also include laser beam expanders, lasers, etc. Its working principle is to incident a laser beam onto two mirrors (scanning mirrors), and control the reflection angle of the mirrors using a computer. These two mirrors can scan along the X and Y axes respectively, achieving the deflection of the laser beam. This allows the laser focal point with a certain power density to move according to the required requirements on the marking material, leaving permanent marks on the material surface. The focused light spot can be circular or rectangular. In the galvanometer scanning system, vector graphics and text can be used. This report studies two axis laser scan head.
