## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Two-Component Silicone Rubber competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of two-component silicone rubber is 213,810 tons, with an average selling price of \$4,200 per ton. Two-component silicone rubber is a silicone elastomer composed of two components (commonly referred to as component A and component B). It is primarily vulcanized at room or elevated temperatures through addition or condensation reactions. Its base polymer is a linear polysiloxane, supplemented with crosslinkers, catalysts, fillers, and other additives. Component A typically contains the polysiloxane and filler, while component B contains the crosslinker and catalyst. When mixed in the correct proportions, it rapidly cures to form a flexible, high- and low-temperature-resistant, age-resistant, non-toxic, and odorless elastomer. This material exhibits excellent flowability, formability, and physiological inertness, making it widely used in the medical, electronics, food, and mold manufacturing industries. It is particularly well-suited for potting, injection molding, and casting of complex structures.

The global Two-Component Silicone Rubber market size was estimated at USD 898.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
