Abstracts

Two-dimensional materials represent a class of nanomaterials characterized by their atomically thin, sheet-like structure, where electrons are free to move in only two dimensions, leading to unique electronic, optical, mechanical, and thermal properties distinct from their bulk counterparts; the most prominent example is graphene, a single layer of carbon atoms arranged in a hexagonal lattice, but the category has expanded to include other monolayer or few-layer materials such as transition metal dichalcogenides (e.g., molybdenum disulfide), hexagonal boron nitride, phosphorene, and MXenes, which are typically produced through methods like mechanical exfoliation, chemical vapor deposition, or liquid-phase exfoliation and find applications across electronics, photonics, energy storage, composites, sensors, and biomedical devices due to their exceptional strength, conductivity, flexibility, and surface-area-to-volume ratios.

The global Two Dimensional Materials market size was estimated at USD 1000.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 22.50% during the forecast period.
