Abstracts

Two-dimensional semiconductor materials are a type of semiconductor materials with a two-dimensional structure, and their thickness is usually only a few atomic layers or a few nanometers thick. These materials exhibit a single-layer structure similar to graphene on a flat surface, but their physical and chemical properties may vary depending on their chemical composition and lattice structure. Two-dimensional semiconductor materials usually have excellent electron transport properties and optical properties, so they have broad application prospects in the fields of electronics and optoelectronics. Compared with traditional three-dimensional semiconductor materials, two-dimensional semiconductor materials are thinner and have a higher surface area to volume ratio, which gives them unique advantages in flexible electronic devices, photoelectric conversion devices, photodetectors, etc.

The global Two Dimensional Semiconductor Materials market size was estimated at USD 173.62 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.00% during the forecast period.
