Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Two-phase Direct-To-Chip Cooling competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Two-phase Direct-To-Chip Cooling is an advanced thermal management technique that leverages phase-change dynamics?liquid to gas and vice versa?to extract heat directly at the chip surface or through a cold plate that contacts the chip. Unlike traditional methods that rely on intermediary fluids like water or thermal oils, this approach delivers coolant phase change right at the heat source, minimizing thermal resistance and significantly enhancing heat removal efficiency. The phase-change process exploits the high latent heat of vaporization, enabling substantial heat dissipation with relatively low coolant flow rates. In 2024, the average price of two-phase direct-to-chip cooling was \$1,100, and the production volume was 818,182 units.

The global Two-phase Direct-To-Chip Cooling market size was estimated at USD 900.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.00% during the forecast period.
