Abstracts

Two-phase immersion cooling is an advanced thermal management technique for high-density electronics, particularly in data centers, where hardware is submerged in a dielectric fluid that boils upon contact with heat-generating components, absorbing thermal energy as it transitions from liquid to vapor; the vapor then condenses on a heat exchanger, returning to liquid form in a closed-loop system that eliminates the need for fans, pumps, or complex plumbing while enabling extreme cooling efficiency, higher power densities, reduced energy consumption, and improved hardware reliability.

The global Two Phase Immersion Cooling market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 22.50% during the forecast period.
