Report Overview

Two-photon Fluorescence Microscopy, means that it is possible to image living tissue to a depth of about 1 mm. It differs from conventional fluorescence microscopy in that the excitation wavelength is shorter than the emission wavelength because the wavelengths of the two excitation photons are longer than the wavelengths of the resulting emission light. Two-photon excitation microscopy usually uses near-infrared excitation light, which can also excite fluorescent dyes. However, for each excitation, the infra-red light of both photons is absorbed.

This report provides a deep insight into the global Two-photon Fluorescence Microscopy market covering all its essential aspects.
