Report Overview

Fluorescence microscopes use short-wave ultraviolet rays as the light source, and the observed specimens are mostly dyed with fluorescent pigments. Due to the irradiation of ultraviolet rays, the fluorescent substances in the specimens are excited to present visible fluorescent images. Because of the short wavelength of the light source, it has a high resolution that exceeds the resolution limit of traditional microscopes, and can directly display biochemical components such as labeled trace fluorescent antibodies. It has an incomparable role in immunology and clinical diagnosis. This report focuses on the investigation and research of fluorescence microscopes, including product categories such as confocal microscopes and two-photon microscopes, and secondly provides separate electron microscope product data.
