Report Overview

Two-Photon Polymerization (TPP) is a maskless direct laser writing technology. With TPP, the light-matter interaction only takes place within the volume of a focused laser spot. The simultaneous absorption of two photons in the focused spot triggers the locally confined polymerization of an exposed photosensitive material. This laser focus can be moved throughout the volume of the photoresist in all three dimensions, allowing for complex 3D structures to be written along the laser's trajectory.

The global Two-Photon Polymerization 3D Lithography market size was estimated at USD 49 million in 2023 and is projected to reach USD 75.15 million by 2030, exhibiting a CAGR of 6.30% during the forecast period.
