Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Two-Piece Clamping Collars competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The two-piece clamping collar is a mechanical fastener consisting of two symmetrical halves that clamp the shaft with screws. It is widely used in industrial applications that require high clamping force, convenient disassembly and assembly, and repeated positioning. Its two-piece design allows for easy installation on any shaft segment without moving other shaft components. It is particularly suitable for a variety of use scenarios such as bearing positioning, limit rings, sensor triggers, and coupling stops. Compared with a single-piece clamping ring, the two-piece structure provides higher radial clamping force and better coaxial stability, and can effectively disperse stress and reduce shaft damage, especially for soft shafts or hollow shaft structures. This product is commonly found in medium and light-load transmission devices such as automation equipment, packaging machinery, medical equipment, food processing, and agricultural machinery transmission systems. It is one of the standard components in the industrial field that combines reliability and assembly flexibility.

The global Two-Piece Clamping Collars market size was estimated at USD 361.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
