## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Two Piece Split Shaft Collar competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The two-piece split shaft collar is a type of mechanical fastener consisting of two symmetrical half rings that are clamped and installed on the shaft by screws. This structural design avoids the limitations of traditional full rings due to the inability to freely disassemble the shaft end. It is particularly suitable for fixed positions that cannot be slid in from the shaft end or require quick assembly and fine-tuning on site. The two-piece structure can be quickly positioned without moving other parts. It is often used for tasks such as bearing positioning, transmission component limitation, and sensor trigger point fixing. It is widely used in industrial automation, packaging machinery, food equipment, medical devices, robot joints and other fields. Its clamping method is usually a hexagon socket screw with a precision machined joint to achieve uniform axial clamping, avoid scratching the shaft surface or causing concentricity deviation, and has excellent reusability and high reliability.

The global Two Piece Split Shaft Collar market size was estimated at USD 371.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
