## Abstracts

A two-stroke outboard motor is an internal combustion engine used for marine propulsion that completes a power cycle?intake, compression, power, and exhaust?in two strokes of the piston (one up and one down movement) per crankshaft revolution, typically utilizing a fuel-oil mixture for lubrication. Characterized by their simple design, high power-to-weight ratio, and mechanical simplicity, these engines are known for delivering strong low-end torque and rapid acceleration, making them particularly suitable for smaller watercraft, portable applications, and performance-oriented boating. However, they are also associated with higher emissions, lower fuel efficiency, and increased environmental regulations compared to four-stroke alternatives, leading to a gradual phase-out in many developed markets but maintaining relevance in regions with less stringent emission standards or where cost and weight are critical factors.

The global Two Stroke Outboard Motor market size was estimated at USD 1450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
