Abstracts

The second triode is also called the transistor, which is the most important device in the electronic circuit. Its main function is current amplification and switching. The triode has three electrodes as its name implies. The diode is made of one PN structure, and the triode is made of two PN structures, and the shared electrode becomes the base of the triode (indicated by the letter b). The other two electrodes become the collector (indicated by the letter c) and the emitter (indicated by the letter e). Due to different combinations, one is an NPN-type transistor and the other is a PNP-type transistor.
