Abstracts

A two-way VHF radiotelephone is a specialized communication device that operates within the Very High Frequency (VHF) band, typically between 156 and 174 MHz, designed for short-to-medium range voice transmission and reception in both land-based and maritime environments. It enables real-time, duplex or semi-duplex communication, allowing users to transmit and receive messages alternately or simultaneously, depending on the model. These radios are characterized by their robustness, reliability, and adherence to international standards, such as those set by the International Telecommunication Union (ITU) and various national regulatory bodies. They are commonly used in sectors where instant, clear, and secure communication is critical, including maritime navigation, aviation ground operations, public safety, emergency services, and industrial applications. Key features often include channel programmability, weather alert capabilities, water and shock resistance, and compatibility with existing VHF infrastructure, making them indispensable tools for operational coordination and safety in challenging or remote environments.
