Abstracts

A two-wheeler knock sensor is an electronic device installed in the engine of motorcycles, scooters, and other two-wheeled vehicles to detect abnormal combustion events, such as knocking or pinging, which occur when fuel ignites prematurely or unevenly in the combustion chamber. By monitoring vibrations and acoustic signals from the engine block, the sensor sends real-time data to the engine control unit (ECU), enabling it to adjust ignition timing and fuel-air mixture to prevent engine damage, optimize performance, and improve fuel efficiency while reducing emissions. Typically integrated into modern fuel-injected two-wheelers, these sensors are critical for maintaining engine health, especially in high-compression engines where the risk of knocking is elevated.

The global Two Wheeler Knock Sensors market size was estimated at USD 1280.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
