Abstracts

Tympanic Thermometer is a non-contact infrared thermometer that measures body temperature by detecting the infrared radiation energy emitted by the eardrum (tympanic membrane) and surrounding tissues. Its core principle is based on the blackbody radiation theory: objects at different temperatures will emit specific wavelengths of infrared spectrum, and the temperature of the tympanic membrane can first reflect changes in body core temperature because it is connected with the blood flow of the hypothalamus (the body temperature regulation center). The built-in high-precision thermoelectric stack (Thermopile) sensor can convert the received infrared signal into an electrical signal, and display the temperature value after microcomputer processing, and the measurement accuracy can reach $\pm 0.1\%$.

The global Tympanic Thermometer market size was estimated at USD 673.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
