Abstracts

Tyrosine kinase inhibitors (TKIs) are a class of targeted anticancer drugs that function by selectively inhibiting the enzymatic activity of tyrosine kinases, which are proteins involved in signal transduction pathways regulating cell growth, proliferation, differentiation, and survival. By blocking these kinases, TKIs disrupt abnormal signaling in cancer cells, particularly those driven by specific genetic mutations or overexpression of kinase proteins, making them a cornerstone of precision oncology. These small-molecule inhibitors are primarily administered orally and are designed to target both receptor tyrosine kinases (such as EGFR, VEGFR, and ALK) and non-receptor tyrosine kinases (like BCR-ABL), offering a mechanism of action that is more specific than traditional chemotherapy, thereby reducing damage to healthy cells and improving therapeutic outcomes for various hematologic malignancies and solid tumors.

The global Tyrosine Kinase Inhibitors market size was estimated at USD 35000.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
