Report Overview

The U-shaped photoelectric switch is a kind of through-beam photoelectric switch, also known as the groove photoelectric switch, which is an infrared induction photoelectric product, which is composed of an infrared emitting tube and an infrared receiving tube, and the slot width determines the induction receiving. The strength of the model and the distance of the received signal, using light as the medium, receive and convert the infrared light between the light emitting body and the light receiving body, and detect the position of the object. The U-shaped photoelectric switch is also non-contact like the proximity switch. It is less restricted by the detection body and has a long detection distance. It can perform long-distance detection (tens of meters) with high detection accuracy and can detect small objects. The U-shaped photoelectric switch is relatively safe and reliable, suitable for detecting high-speed changes, distinguishing transparent and translucent objects, and can adjust the sensitivity. When the object to be detected passes by, the sufficient amount of light emitted by the infrared transmitter of the optical U-shaped electric switch is reflected to the infrared receiver receiver, so the photoelectric switch generates a switching signal.
