Abstracts

An electronic governor for unmanned aerial vehicles (UAVs) is a specialized electronic control unit designed to automatically regulate and stabilize the rotational speed of a UAV's engine or motor by continuously monitoring and adjusting throttle input in response to real-time load variations, flight conditions, and pilot commands. It enhances flight performance, improves fuel or battery efficiency, reduces mechanical stress on propulsion components, and ensures consistent power delivery—especially critical in applications requiring precise speed control such as aerial photography, surveying, payload delivery, or formation flying. Modern UAV governors often integrate with flight controllers and telemetry systems, employing feedback mechanisms like RPM sensors and advanced algorithms to maintain setpoints despite disturbances like wind gusts or changes in altitude.

The global Uav Electronic Governor market size was estimated at USD 125.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
