Abstracts

The UAV-mounted IR imager is a device installed on a UAV that detects the infrared radiation emitted from the surface of a target object and converts it into a visible thermal image. It utilizes the characteristic that objects emit infrared radiation of different intensities at different temperatures, enabling real-time acquisition of the target's temperature distribution and thermal state image without physical contact. The UAV-mounted UV imager is an instrument carried by a UAV for detecting and capturing the UV radiation signals emitted by a target object and converting them into visible images. Its working principle is based on the fact that phenomena such as corona discharge generate UV light. By using a high-sensitivity UV detector to receive these UV signals and then processing and imaging them, operators can intuitively observe corona discharge, partial discharge, and other conditions on the surface of the target object.

The global UAV-mounted IR Imagers and UV Imagers market size was estimated at USD 806.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
