Abstracts

Ultra High Nickel (UHN) batteries represent an advanced class of lithium-ion batteries characterized by cathodes with nickel content typically exceeding 90%, often approaching or even surpassing 95%, which significantly increases energy density compared to conventional high-nickel NMC (Nickel Manganese Cobalt) or NCA (Nickel Cobalt Aluminum) formulations. This heightened nickel concentration reduces reliance on cobalt?a costly and geopolitically sensitive material?while enabling greater storage capacity per unit weight or volume, making these batteries particularly suitable for applications demanding extended range or operational duration, such as electric vehicles (EVs) and high-end consumer electronics. However, the elevated nickel content introduces challenges related to structural instability, accelerated degradation, and thermal management, necessitating sophisticated material engineering?including surface coatings, doping techniques, and advanced electrolytes?to mitigate issues like cation mixing, oxygen release, and capacity fade over cycles.

The global Ultra High Nickel Battery market size was estimated at USD 1874.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.60% during the forecast period.
