Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Ultra-High Power PV Modules competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Ultra-high power PV modules refer to photovoltaic power generation units with a single module power output exceeding 600W. This significant power increase is achieved by utilizing large-size silicon wafers (such as 182mm or 210mm), high-efficiency cell technologies (such as HJT, TOPCon, or tandem cells), and optimized packaging techniques (such as half-cut cells, multi-busbar, and bifacial power generation). The significance of ultra-high power modules lies in their ability to generate higher power output with fewer modules, thereby reducing the system installation area, decreasing the use of auxiliary materials like supports and cables, and optimizing the levelized cost of electricity (LCOE) of photovoltaic power stations. Their main benefits include: enhancing land use efficiency, especially in areas with limited land resources; reducing the Balance of System (BOS) costs, improving the project's economy; and increasing system reliability, as the reduced number of modules lowers the risk of connection point failures. Functionally, ultra-high power modules support a variety of application scenarios, such as ground-mounted power stations, distributed rooftops, and floating PV, with the bifacial design further leveraging reflected light gains.

The global Ultra-High Power PV Modules market size was estimated at USD 13670.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.00% during the forecast period.
