Abstracts

UHT Dairy Products (Ultra-High Temperature Dairy Products) refer to dairy products that have been processed using the UHT (Ultra-High Temperature) method, which is a heat treatment process designed to extend the shelf life of dairy products without the need for refrigeration. This process involves heating milk or other dairy products to very high temperatures (typically around 135°C to 150°C or 275°F to 302°F) for a very short period (usually 2 to 5 seconds), then rapidly cooling it down. The adoption of advanced UHT processing technologies is enabling dairy companies to enhance product stability during storage. For instance, Amul has increased its daily processing capacity and diversified its product range, attracting more consumers and boosting profitability. Consumers are increasingly seeking dairy products that are easy to store and have extended shelf lives, reducing the need for refrigeration and frequent purchases. As urban populations grow, the demand for convenient food options like UHT milk, which doesn't require refrigeration, is on the rise.

The global Ultra-High Temperature (UHT) Dairy Products market size was estimated at USD 141410.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
