Abstracts

Ultra low jitter clocks are precision timing devices that generate highly stable frequency signals with exceptionally low timing errors, characterized by phase jitter typically measured in femtoseconds (fs) or picoseconds (ps) RMS. These clocks are engineered to minimize random fluctuations in signal timing, which is critical for maintaining signal integrity, reducing bit error rates, and ensuring synchronization accuracy in high-performance electronic systems. They are distinguished from standard clock sources by their specialized design, which often involves advanced phase-locked loop (PLL) architectures, temperature-compensated or oven-controlled crystal oscillators (TCXO/OCXO), and noise-reduction techniques to achieve superior spectral purity and temporal precision.

The global Ultra Low Jitter Clock market size was estimated at USD 155.68 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
