Report Overview:

Ultra-thin lenses, as the name suggests, are lighter, thinner, and more comfortable eyeglass lenses. Ultra-thin lenses are made of high refractive index materials. Under the same degree, the higher the refractive index, the thinner the lens will be. Using materials with a high refractive index can reduce the curvature of the lens to obtain a concave lens with the same power but thinner edges or a convex lens with a thinner center. Unlike traditional lenses, high-refractive-index lenses increase the refractive index by changing the molecular structure of the material. As the refractive index increases, the weight of the lens does not necessarily increase, and some even decrease.

The Global Ultra-thin Lenes Market Size was estimated at USD 1601.36 million in 2023 and is projected to reach USD 1857.09 million by 2029, exhibiting a CAGR of 2.50% during the forecast period.
