Abstracts

The ultra-thin nanocrystalline ribbons adopts the ultra-rapid solidification technology with a cooling rate of about 10^6 °C/s. Compared with traditional materials, it has high magnetic permeability and low loss. It is an excellent soft magnetic material, and its thickness is usually 14 -26 microns. Nanocrystalline alloy is a material that uses an alloy melt containing iron, silicon, boron, niobium, copper and other elements to form a dispersed and uniform nano-island structure on an amorphous basis through rapid and high-precision cooling technology. Compared with ferrite, amorphous and other soft magnetic materials, nanocrystalline ultra-thin ribbons have the advantages of high saturation magnetism, low coercive force, high initial magnetic permeability, high Curie temperature rate, etc., and their comprehensive magnetic properties are better than ferrite. , can reduce the size of magnetic devices and reduce the loss of magnetic devices, becoming the best soft magnetic material in high-frequency power electronics applications. It is mainly used to produce inductive components, electronic transformers, transformers, sensors, etc. As fields such as new energy vehicles, new energy power generation, consumer electronics, and particle accelerators pay more and more attention to characteristics such as large current, high frequency, small size, lightweight, and energy saving, nanocrystalline ultra-thin ribbons are expected to accelerate the replacement of traditional ferrite.

The global Ultra-Thin Nanocrystalline Ribbons market size was estimated at USD 2108.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.20% during the forecast period.
