Report Overview

The ultracapacitor is an energy storing device. It is electro-chemical in nature and has a relatively high energy density as compared to other capacitors or batteries. This device exhibits a higher power capacity, improved lifecycle, and faster charging capability. An ultracapacitor is also known as electrical double-layer capacitor (EDLC). It does not possess a conventional dielectric, and instead carries two plates separated by an electrolyte.

Engineering innovations continue to advance the ultracapacitor technology and are anticipated to be a primary factor instigating the convergence of supercapacitors and batteries. This is further expected to strengthen the combination of pulse power design and specific energy storage in future application areas including residential power, public transportation, medicine, and construction equipment which may also drive product demand.
