Abstracts

Ultrafine titanium dioxide, often referred to as nanoscale titanium dioxide (with particle sizes typically below 100 nanometers), is a specialized form of titanium dioxide (TiO₂) characterized by its unique optical, photocatalytic, and ultraviolet (UV)-blocking properties, which differ significantly from those of conventional, larger-particle TiO₂ due to increased surface area and quantum effects; it is primarily utilized in high-performance applications such as sunscreens (for its transparency and broad-spectrum UV protection), self-cleaning coatings (leveraging its photocatalytic activity to break down organic pollutants), advanced paints and coatings (for enhanced durability and anti-fouling characteristics), cosmetics, and certain electronic and catalytic processes, where its nano-specific attributes provide functional advantages over standard-grade material.

The global Ultrafine Titanium Dioxide market size was estimated at USD 4050.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
