Report Overview

Ultrasonic air in line sensors detects the presence of an air bubble in the fluid delivery lines of medical systems as a failsafe mechanism. Small amount of air can result in air or gas embolisms and enter the bloodstream, forming bubbles. If air enters blood vessels by accident during transfusion or surgery via any arterial or venous fluid line, the resulting bubbles can block blood flow, which may lead to a stroke, heart attack, etc. Thus, the non-invasive ultrasonic detection of air bubbles plays an important role in the medical industry.
