Abstracts

Ultrasonic atomization transducer is a device that uses the ultrasonic principle to atomize liquid into tiny particles. Its core technology relies on the piezoelectric effect or mechanical vibration principle. When ultrasonic waves are transmitted to the liquid, the surface of the liquid will vibrate violently, forming extremely fine droplets or atomized particles. In this way, the molecules of the liquid can be dispersed in a very fine form, usually at the micron or even nanometer level.

The global Ultrasonic Atomization Transducer market size was estimated at USD 380.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
