## Abstracts

Ultrasonic Bone Cutting System is a medical device that uses high-frequency sound waves (ultrasound) to precisely cut bone while minimizing damage to surrounding soft tissues. The system operates by generating ultrasonic vibrations that are transferred to a specialized cutting tool, typically a blade or tip, allowing for smooth and controlled bone removal with less heat generation, blood loss, and trauma compared to traditional mechanical cutting methods. It is commonly used in orthopedic and dental procedures where precision and reduced tissue disruption are crucial. The system is praised for its ability to provide clean cuts, improve surgical outcomes, and enhance recovery times.

The global Ultrasonic Bone Cutting System market size was estimated at USD 117.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.40% during the forecast period.
