Abstracts

Ultrasonic bone densitometers are non-invasive medical devices that employ quantitative ultrasound (QUS) technology to assess bone density and quality, primarily by measuring the speed of sound (SOS) and broadband ultrasound attenuation (BUA) through peripheral skeletal sites such as the calcaneus (heel bone). These devices serve as diagnostic tools for evaluating bone health, aiding in the early detection of osteoporosis and fracture risk assessment, and are characterized by their portability, absence of ionizing radiation, and lower operational costs compared to central DXA systems, making them particularly suitable for primary care settings, community health screenings, and point-of-care testing.

The global Ultrasonic Bone Densitometer market size was estimated at USD 523.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
