Abstracts

Ultrasonic cell disrupters, also known as ultrasonic homogenizers or sonicators, are laboratory instruments that utilize high-frequency sound waves (typically in the 20?50 kHz range) to induce cavitation in liquid samples, mechanically breaking open cells, disrupting tissues, and dispersing or emulsifying particles through the violent collapse of microscopic bubbles generated by ultrasonic energy. These devices consist of a generator that produces high-frequency electrical signals and a transducer (often a piezoelectric probe) that converts these signals into mechanical vibrations, which are then transmitted into the sample via a titanium or stainless steel tip, enabling applications such as cell lysis, nanoparticle preparation, DNA shearing, and enzyme extraction across fields like molecular biology, pharmaceuticals, and nanotechnology.

The global Ultrasonic Cell Disrupter market size was estimated at USD 275.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
