Report Overview

It is composed of the electrical part that receives the electrical signal of the ultrasonic generator and the mechanical part that vibrates at high frequency to generate sound waves in the cleaning liquid. Once received, the electrical signal is applied to the piezoelectric crystal, thereby converting the signal into vibration. The heavy metal plate is attached to the crystal and amplifies the vibration in a larger area. The entire structure is enclosed in a stainless steel shell, and the vibration is transmitted to the outside through the steel. When the transducer is immersed in the cleaning liquid, the vibration will generate corresponding ultrasonic waves in the liquid. Acoustic waves are compression waves that propagate as a liquid with compression peaks and valleys. In the tank, cavitation bubbles are formed due to the low pressure, and the bubbles collapse again at the peak of the high pressure. The collapsed bubbles release high-energy cleaning solutions that remove dust and contaminants from the surface of the part. The scrubbing action of these nozzles can effectively and quickly clean the parts without damaging the underlying surface.
