Abstracts

Ultrasonic contrast media, also known as ultrasound contrast agents (UCAs), are intravascular diagnostic substances administered to patients to enhance the echogenicity of blood and improve visualization of anatomical structures, blood flow patterns, and tissue perfusion during ultrasound examinations. These agents consist of gas-filled microbubbles stabilized by shells made of lipids, proteins, or polymers, which resonate in response to ultrasound waves, producing strong harmonic signals that significantly increase image resolution. Their primary clinical applications include cardiology for assessing myocardial viability and wall motion, radiology for characterizing liver lesions and other abdominal abnormalities, and emerging uses in oncology and inflammatory disease monitoring.

The global Ultrasonic Contrast Media market size was estimated at USD 1565.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
