Abstracts

Ultrasonic corner sensors are non-contact detection devices that utilize high-frequency sound waves to measure distances and detect the presence, position, or absence of objects in hard-to-reach or obstructed areas, particularly in corners or blind spots where traditional sensors may fail due to mounting constraints or limited field of view; these sensors typically emit ultrasonic pulses and calculate the time taken for the echo to return, enabling precise object detection even in challenging environments characterized by dust, moisture, or varying light conditions, and are commonly integrated into applications such as industrial automation, robotics, automotive parking assistance, smart infrastructure, and security systems to enhance spatial awareness and prevent collisions.

The global Ultrasonic Corner Sensor market size was estimated at USD 285.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.15% during the forecast period.
