Abstracts

An ultrasonic cutting system is a technology that utilizes high-frequency mechanical vibrations, typically in the range of 20-40 kHz, transmitted through a blade or horn to cut, seal, or perforate materials with precision, minimal friction, and reduced force. Unlike conventional mechanical cutting, it operates by causing localized heating and material fatigue at the cutting edge, enabling clean, sealed edges—especially in heat-sensitive, fibrous, or layered materials—while minimizing debris, deformation, and operator effort. These systems are widely valued in industries requiring high accuracy and sterility, such as food processing, textiles, medical device manufacturing, and composites, due to their ability to handle delicate or challenging substrates without compromising structural integrity or hygiene.

The global Ultrasonic Cutting Systems market size was estimated at USD 220.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
