Report Overview

Dental ultrasonic scalers use ultrasound to remove calculus deposits from your teeth more effectively. They work mechanically using high vibrational energy that effectively blasts calculus, so it is easier to remove. Ultrasonic scalers also create shock waves that disrupt bacteria biofilms so that the plaque bacteria and calculus can be therapeutically flushed from the teeth by a small jet of water or antibacterial mouthwash which is emitted from near the top of the scaler. The jet of water helps to cool the tip of the ultrasonic scaler and is highly effective at helping to flush away debris from the tooth being treated. The turbulent action caused by the vibrating tip of the ultrasonic scaler also causes some of the water to break into lots of tiny bubbles. These bubbles help to disrupt, and rupture bacteria and they create an oxygenated environment that is more hostile to harmful anaerobic or oxygen-hating bacteria.

The global Ultrasonic Dental scalers market size was estimated at USD 722 million in 2023 and is projected to reach USD 975.49 million by 2032, exhibiting a CAGR of 3.40% during the forecast period.
