Report Overview

Ultrasonic extraction is the use of multi-level effects such as strong cavitation, disturbance effects, high acceleration, crushing and stirring effects generated by the pressure of ultrasonic radiation to increase the frequency and speed of the movement of material molecules and increase the penetration force of the solvent to accelerate the entry of the target component Solvent to promote the extraction. The rapid mechanical vibration wave is generated by the ultrasonic transducer. Using the energy of the ultrasonic wave, the uniformity of the ultrasonic wave function is increased, and the sound intensity is increased, so that the boundary layer of the particles becomes thin, the outer surface is peeled off, the particles are fragmented, and the outer walls of the cells are broken by ultrasonic waves Therefore, the material in the tissue cell wall is freed into the solution, the process of dissolving the active ingredient in the substance in the solvent is accelerated, and the force between the target extract and the sample matrix is reduced, thereby realizing solid-state liquid extraction separation to improve the extraction rate of the effective ingredient. . The ultrasonic extraction machine is mainly composed of a high-power ultrasonic generation system, a heating system, a compressor refrigeration system, a temperature measurement and temperature control system, a reflux condensation system, an agitated internal circulation system, etc.

The global Ultrasonic Extraction Machine market size was estimated at USD 185.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
