Abstracts

An ultrasonic flare flowmeter is an instrument used to measure the flow rate of flare gases. It operates based on the relationship between the time difference or frequency difference of ultrasonic waves traveling downstream and upstream in the gas and the gas flow velocity. By emitting and receiving ultrasonic signals, it calculates the velocity of the flare gas through signal processing, and then obtains the flow rate. It features high accuracy, non-contact measurement, no pressure loss, and the ability to measure various gases. It can work stably under harsh conditions and is widely used in flare systems in industries such as petroleum and chemical engineering for the accurate monitoring and control of flare gas flow.

The global Ultrasonic Flare Flowmeter market size was estimated at USD 77.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
