Abstracts

Ultrasonic frequency induction heating equipment is an industrial equipment that uses the principle of electromagnetic induction to efficiently convert electrical energy into thermal energy, and heats metal materials quickly, locally, and contactlessly. Its operating frequency is usually between 10kHz and 100kHz, between high frequency and medium frequency, so it is called "supersonic frequency". The heating method of this equipment is to pass an alternating current through an induction coil to generate eddy currents in the heated metal workpiece, causing it to heat itself, thereby achieving the purpose of rapid heating. Due to its moderate frequency, the supersonic frequency equipment has achieved a good balance between heating depth and heating speed, and is particularly suitable for local heat treatment of small and medium-sized workpieces.

The global Ultrasonic Frequency Induction Heating Equipment market size was estimated at USD 110.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
