## Abstracts

An ultrasonic microwave extractor is a laboratory device that combines ultrasonic and microwave technologies to enhance the extraction of compounds from solid or liquid samples. By integrating both modalities, this system accelerates extraction processes, improves yield, and often requires lower temperatures or shorter extraction times compared to conventional methods. The ultrasonic component uses sound waves to create microscopic bubbles (cavitation) that help break apart sample materials, while the microwave component rapidly heats the sample, further improving the efficiency of the extraction process.

The global Ultrasonic-Microwave Extractor market size was estimated at USD 300.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
