Abstracts

Ultrasonic motion sensors are electronic devices that detect movement by emitting high-frequency sound waves (typically between 20 kHz and 60 kHz) and measuring the time it takes for the echoes to return, utilizing the principle of echolocation; they are distinguished from other motion-sensing technologies (like passive infrared or microwave sensors) by their ability to detect objects regardless of material, color, or transparency, making them effective in challenging environments such as those with dust, smoke, or varying lighting conditions, and they are commonly used in applications ranging from security systems and automatic doors to industrial automation and robotics for presence detection, object avoidance, and liquid level sensing.

The global Ultrasonic Motion Sensor market size was estimated at USD 1245.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.65% during the forecast period.
