## Abstracts

Ultrasonic oil level sensor is a measuring device based on ultrasonic technology. It measures the height of the oil by emitting ultrasonic signals and receiving their reflected waves. When the ultrasonic signal encounters the surface of the oil, it is reflected back to the sensor. The sensor determines the height of the oil by calculating the signal transmission time and speed, and then accurately monitors the changes in the oil level. This sensor does not contact the oil and is suitable for various types of fuel tanks, such as automobiles, aviation, industrial equipment, etc. It has the characteristics of high precision and corrosion resistance.

The global Ultrasonic Oil Level Sensor market size was estimated at USD 1366.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.30% during the forecast period.
