Abstracts

An ultrasonic retainer cleaner is a specialized cleaning device designed specifically for cleaning dental retainers. It utilizes ultrasonic waves, which are high-frequency sound waves typically above the range of human hearing. When the device is activated, these waves create millions of microscopic bubbles in the cleaning liquid within the chamber. These bubbles implode near the surface of the retainer with great force, known as cavitation, effectively dislodging dirt, plaque, bacteria, and other debris from the retainer's surface, providing a thorough and efficient cleaning method to maintain the hygiene and proper condition of the dental appliance.

The global Ultrasonic Retainer Cleaner market size was estimated at USD 411.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
