Abstracts

Ultrasonic underwater ranging sensor is a precision measuring device based on the propagation characteristics of ultrasonic waves. It is widely used in underwater detection, positioning and monitoring. Its working principle is to transmit ultrasonic signals through the sensor. When the ultrasonic wave propagates in the water and encounters the target object, part of the signal will be reflected back. The sensor calculates the distance or water depth of the target object based on the time difference between the transmitted and received signals and the propagation speed of the sound wave in the water. Ultrasonic underwater ranging sensor has the characteristics of high measurement accuracy, strong anti-interference ability and good environmental adaptability, and can provide reliable data support in complex underwater environments.

The global Ultrasonic Underwater Ranging Sensor market size was estimated at USD 94.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
