Report Overview:

Ultrasonic welding is the joining or reforming of thermoplastics or other materials through the use of heat generated from high-frequency mechanical motion. It is accomplished by converting high-frequency electrical energy into high-frequency mechanical motion. That mechanical motion, along with applied force, creates frictional heat at the plastic or other materials components' mating surfaces (joint area) so the material will melt and form a molecular bond between the parts.

The Global Ultrasonic Welding Technology Market Size was estimated at USD 553.22 million in 2023 and is projected to reach USD 676.12 million by 2029, exhibiting a CAGR of 3.40% during the forecast period.
